Abstract

A method and system for using web services to notify a subscriber that an event has occurred at a voice mail switch and to retrieve the event is described. A notification server receives an event and an associated identifier from the voice mail switch. The identifier is correlated to a subscriber and an alert indicating that the event occurred is generated. The alert is sent to a destination selected by the subscriber. The alert includes an event reference that links the subscriber to the event through a network via a URL. The subscriber retrieves the event through a web portal view associated with the URL.
